CRISIS IMPACT OVERVIEW

- Heavy monsoon rains in mid and late August 2022 in Odisha state resulting from the deep depression over the Bay of Bengal have led to overflowing rivers and landslides that have affected at least 13 districts (HAI 26/08/2022; Mint 18/08/2022 and 19/08/2022; HT 23/08/2022; SRC 22/08/2022). Its impact combined with the subsequent heavy rains in the upper catchment of the Subarnarekha River, in the neighbouring state of Jharkhand, has led the state government to open the Galudih Barrage, releasing floodwaters into Odisha and worsening the flood situation (OTV 20/08/2022; NDTV 22/08/2022; HAI 26/08/2022).
- As at 22 August, the monsoon rains had affected around 2,500 villages, with more than 900 additional villages still inundated. The floods had affected over 950,000 people in Odisha, and around 170,000 people were temporarily residing in around 440 relief centres (SRC 22/08/2022; NDTV 23/08/2022).
- The floods have severely affected Boudh, Cuttack, Jagatsinghpur, Kendrapara, Khurda, Puri, Sambalpur, and Subarnapur districts, with Puri and Jagatsinghpur being the most affected (HAI 26/08/2022).
- The floods have destroyed farmlands, crops, livestock, roads, bridges, and electricity poles — resulting in power cuts (HAI 26/08/2022; The New Indian Express 25/08/2022 and 29/08/2022; The Times of India 22/08/2022; OTV 21/08/2022 a).
- Immediate needs for the people living in flood-affected areas and displaced people include food (especially the main staple food, rice, and dry foods), potable drinking water, fuel, sanitary pads and hygiene kits, water purification kits, polythene sheets, and shelter. In the longer term, affected people need livelihood support (e.g. cash-for-work programmes and the provision of fertiliser, livestock, and fodder to affected farmers). People who lost their homes to the floods also require rebuilding support.

ANTICIPATED SCOPE AND SCALE

- Light to moderate rain or thundershower is forecasted for a few places over the districts of Odisha until 05 September. Some of these areas are likely to still be experiencing flooding, and additional rains could deteriorate the flood situation in the coming days (IMD 30/08/2022).
- Natural disasters often push the younger generation, including children, towards distress migration, which would raise protection concerns (HAI 26/08/2022). Potential risks include child labour and trafficking.
- The floods have destroyed a lot of houses, especially fragile kutcha houses. People residing in these houses are usually socioeconomically disadvantaged and lack the capacity to cope with shocks such as floods (NBO 2013; Square Yards 22/07/2021). A significant percentage of the displaced have become homeless and are expected to remain displaced in the longer term. They will require shelter, food, and NFIs for an extended period, even after the alleviation of the flood situation.

HUMANITARIAN CONSTRAINTS

- Flooding has destroyed roads and bridges, disrupting transportation. Rural Odisha also lacks proper road infrastructure. As per the latest reports, some inundated places are only accessible by boats, heightening humanitarian access constraints in the state (The Times of India 22/08/2022; HAI 26/08/2022; OTV YouTube 22/08/2022 and 25/08/2022).
- Aid workers are exposed to waterborne diseases and snake bites, especially with Odisha being one of the most snakebite-prone states in India (The Hindu 17/04/2022; The Telegraph 26/08/2022).
- Floods have also resulted in power cuts. Many villages have been without electricity for days, disrupting daily life, especially mobile phone communication (The New Indian Express 25/08/2022, 22/08/2022, and 23/08/2022). This constraint is likely to disrupt communications between aid workers and flood-marooned people.
- Long power cuts have been reported in Puri and Khurda districts (The New Indian Express 23/08/2022). Power cuts are also interrupting aid activities in public places, such as healthcare centres and temporary shelters.
- There are limited assessments of humanitarian needs and damages, which can be a constraint for humanitarian responders in identifying the most affected areas and the locations of vulnerable groups (The New Indian Express 25/08/2022 and 23/08/2022).

SECTORAL NEEDS

Health

Around 900 cases of waterborne diseases were reported in the flood-affected districts, with some reported as diarrhoea cases. Some people have resorted to drinking contaminated water amid the shortage of potable water in inundated villages. This practice risks the spread of waterborne diseases, such as hepatitis and cholera. Affected villages require a supply of potable water, as well as water point restoration and chlorination. Stagnant water could become breeding grounds for the Aedes mosquito and spread the dengue disease. The Government also reported receiving around 90 reports of snake bites from the flood-affected districts. No deaths have been reported, citing that every block (district subdivision) has antivenom drugs (The Telegraph 26/08/2022; The Logical Indian 26/08/2022; The New Indian Express 26/08/2022 and 03/09/2014).

Children can experience distress in natural disaster settings given the lack of open areas to play in and for being confined to their houses or relief centres. Children and their families also suffer from diseases and injuries; concerns of snake bites; and a lack of access to fundamental services, such as clean water, healthcare, and education. They need targeted psychosocial support (HAI 26/08/2022; UNICEF accessed 29/08/2022). Children are also in danger of falling into the floodwaters as people gather on high ground given the limited space, increasing the risk of ingestion of contaminated water and drowning.

WASH

WASH facilities, such as toilets, are submerged in flood-affected areas, likely resulting in unsafe sanitation practices, such as open defecation. The lack of adequate sanitation facilities makes women and children particularly vulnerable to protection concerns given the lack of privacy. Female hygiene would be of heightened concern, with affected women and girls needing access to sanitary pads and hygiene kits, as well as to sexual and reproductive health services (News18 23/08/2022; OTV 21/08/2022 b; OHCHR accessed 29/08/2022).

Protection of vulnerable communities

There are 93 recognised Scheduled Caste communities in Odisha. They comprise around 17% of the state's total population (Nayak 01/07/2018; SCSTRTI accessed 28/08/2022). These communities are estimated to earn much less (35% lower) than the national average (IndiaSpend 15/03/2021). They have been experiencing discrimination and persecution for years, facing a host of human rights violations and abuse as well as social and economic boycotts

(Gunratna and Anjali 26/10/2020). They also face discrimination in terms of relief distribution, which may be a risk during this flood crisis (The Kathmandu Post 17/10/2020).

Shelter

Around 170,000 displaced people are residing in 440 relief centres in Odisha (SRC 22/08/2022). These shelters are usually temporary and hosted in public places, such as schools. They are usually overcrowded and lack adequate living space, leading to unhygienic living conditions. The lack of space also means a lack of privacy for women and children, raising protection concerns. It is very likely that there are people who have lost their homes and are stranded, as has happened during previous floods. Affected people need shelter.

Education

There have been reports of floodwaters damaging books and other learning materials of students and sweeping away their clothes. The flooding has also damaged schools (OTV 21/08/2022 b; The New Indian Express 23/08/2022). Given the situation, schools are being used as relief centres, and they often require rehabilitation or repair before being usable for classes again (Sambad 17/08/2022). These constraints further limit children's access to education.

Food security and livelihood

Floodwater has inundated paddy fields, incurring damage to already planted paddy crops. The Kharif season usually starts in June and ends in December. Paddy is a major Kharif crop (PxD 15/07/2021). Floodwater has also been reported to destroy many vegetable farmlands and fodder, sweep some livestock away, and affect others, resulting in the animals' death, injury, or affliction with diseases (HAI 26/08/2022; The New Indian Express 25/08/2022; SRC 22/08/2022). In Puri district, the floods have affected around 50,000 large livestock, 18,000 small livestock, 60,000 poultry livestock, and around 9,000 hectares of crops (HAI 26/08/2022; CYSD 24/08/2022). As at 29 August, many farmlands in multiple districts, including Balasore, Cuttack, Kendrapara, and Puri, were still inundated (OTV 29/08/2022).

Around 80% of Odisha's population lives in rural areas, with the majority of the rural labour force engaged in agricultural activities. The agriculture sector is the main source of livelihood for a significant portion of the population (P&C Dept. 03/2022). Many farmers also take loans from cooperative societies and banks to grow seasonal vegetables and paddy. The floods have led them to incur significant losses, leaving them uncertain of regaining their lost livelihoods. With people's livelihoods severely affected, there is a need for livelihood programmes, such as cash-for-work programmes (HAI 26/08/2022; CYSD 24/08/2022).

Rice is the staple food of the people of Odisha. The floods damaging paddy fields is likely to affect the food security of the state. Affected people have requested rice, fuel for cooking, dry ration, potable drinking water, and cooked food (The New Indian Express 26/08/2022).

AGGRAVATING FACTORS

Poverty

Around 30% of people in Odisha live in multidimensional poverty (given the measured indices of health, knowledge, income, employment, and household environment). An estimated 90% of the poor are from rural areas. The floods from the heavy rains damaging farmlands and livestock has severely affected these people (P&C Dept. 03/2022; Sahoo 10/11/2015).

Pre-existing transport challenges

Rural Odisha lacks proper road connectivity and bridges, especially over small rivulets and streams. The state also has numerous road projects still under construction, and the construction of many others has been deferred (The New Indian Express 03/07/2017; OTV 17/07/2022).

Frequent natural disasters and the dependence of rural communities on agriculture

Agriculture is the primary source of livelihood for the people of rural Odisha, and the damage to farmlands, crops, and livestock will result in the loss of livelihood for many (HAI 26/08/2022; P&C Dept. 03/2022). Odisha is prone to floods, and it experiences flooding every year. The continuous loss of livelihood because of floods could push community members into deep poverty and render them assetless. They will need more robust protection for their farmlands, livestock, and livelihood. Other natural disasters, such as cyclones that occur quite frequently in Odisha, also compound the issue, especially in coastal districts such as Puri and Jagatsinghpur.

Existing housing vulnerabilities

More than 40% of families in rural areas of Odisha live in kutchha houses, which are made of weak materials such as clay, reeds, pebbles, and wood (NBO 2013; Square Yards 22/07/2021). These houses are quite vulnerable to natural disasters, such as floods and cyclones. Floods have been reported to have washed away many such houses. The population living in such houses also tend to come from the socially and economically disadvantaged sector, meaning they do not have adequate savings to cope with events such as floods by themselves.

State of health

Odisha state's maternal and infant mortality rates are higher than the average in India, indicating that the state is lagging in ensuring adequate health services to children and mothers. The impact of flooding compounds these groups' already heightened risks (P&C Dept. 03/2022).

Odisha state location and flood-affected areas

*The maps for 19–21 August 2022 indicate the areas the floods have affected. The map for 29 August 2022 shows the current flooding situation.

Date: October 06, 2022

Dear Sir,

Sub: Odisha Floods 2022 – Near Real Time Inundation Mapping using satellite data

Satellite data derived Flood inundation map in parts of Odisha State was provided earlier through the email dated 28th Aug, 2022. Further, NRSC has provided 7 flood inundation maps so far during 2022 and is keeping watch on the assessment of flood situation in Odisha State.

Presently, Sentinel-1A SAR satellite data of 05 October, 2022 is analysed for assessment of flood inundation. Flood inundation map, A brief report is enclosed herewith. As image was acquired during / immediate to the rainfall events, observed flood inundation may include wet areas/ rain water accumulation/ water in low lying areas.

Geospatial layers can be visualised at the following NRSC portal
Bhuvan : <https://bhuvan-app1.nrsc.gov.in/disaster/disaster.php?id=flood>
NDEM : <https://ndem.nrsc.gov.in>

Inundation layer in GIS ready format and area wise statistics are provided to Odisha Remote Sensing Application Centre (ORSAC) by e-mail for further value addition and dissemination to concerned user departments.

We will continue to keep a watch on the flood situation and update the information as and when required. Your support and active interaction & feedback is highly appreciated.

With kind regards

Yours sincerely,
(Dr. A V SURESH BABU)

Flood Inundation Mapping using Satellite Data – Odisha Floods – 2022

1. Background

Rains are reported in Odisha and they caused rise in river water levels in Subernarekha river basin and affected parts of Odisha state. According to reports, River Jalka at Mathani Road Bridge was reported to be flowing above danger level.

(Source: CWC)

2.0. Satellite Data

Flood disaster team is keeping a constant watch on the situation and checked the satellite data coverage over the affected areas. Sentinel-1A SAR satellite data of 05 October, 2022 was acquired and analyzed. (Refer Table-1).

Table-1 Satellite Data acquired over Heavy Rain Affected Area

S No	Date	Satellite/Sensor	Status
1	16-08-2022	Resourcesat-2 AWiFS (1030 Hrs) Sentinel-1A SAR (0600 Hrs)	Map provided
2	18-08-2022	Sentinel-1A SAR (1800 Hrs)	Map provided
3	19-08-2022	RADARSAT-2 SAR (1800 Hrs)	Map provided
4	21-08-2022	Sentinel-1A SAR (0600 Hrs)	Map provided
5	22-08-2022	RISAT-1A SAR (1800 Hrs)	Map provided
6	24-08-2022	RISAT-1A SAR (1800 Hrs)	Map provided
7	28-08-2022	Sentinel-1A SAR (0600 Hrs)	Map provided
8	05-10-2022	Sentinel-1A SAR (1800 Hrs)	Map provided
9	05-Oct-2022	Sentinel-1A SAR (1800 Hrs)	Map is attached herewith showing Flood inundation as per the spatial coverage of the satellite on 05th Oct 2022

3.0 Data Analysis

Satellite data is rectified and inundation layer is extracted. Further, inundation map was composed for part of Odisha state based on the analysis of Sentinel-1A SAR satellite data of 05 October, 2022. The inundation layer is integrated with district boundaries layer, for extracting district-wise inundation statistics which are shown in the Table-2.

Based on the analysis of satellite data, the following points were observed.

- Satellite data covers part of Odisha state.
- Major inundation was observed in Baleshwar district.
- Observed inundation may include wet areas/ rain water accumulation / water in low lying areas.

Table-2: District-wise inundated area statistics

S. No.	District	Flood Inundated Area (ha)
1	BALESHWAR	915
2	MAYURBHANJ	142
	TOTAL	1056

Note:

- Flood inundation may include rain water accumulation / flood water in low lying areas.
- Districts with inundation less than 100 ha are not included in the statistics.
- * Satellite Data Coverage is partial in the district

15.	Abstract (with Keywords): Flood hazard zonation is one of the important initiatives towards flood risk reduction. Satellite remote sensing helps in identifying the flood inundated areas in near real-time. This observed information over years further helps in identifying the frequently flood affected areas. In this approach, 18 years (2001-2018) of data from Indian and foreign satellites was used in identifying the flood hazard zones based on frequency of flood inundation. The flood hazard is categorised into 5 classes, i.e., very high, high, moderate, low and very low based on the frequency of inundation. This atlas can help in understanding the flood problem in various districts of Odisha State and help the planners accordingly.				

Naveen Patnaik
Chief Minister, Odisha

State Secretariat
Bhubaneswar

MESSAGE

Flood is a major natural calamity faced in Odisha almost every year resulting in substantial loss of lives and properties and disruption of livelihood system. In fact, better understanding of the flood events over a period of time can be helpful in addressing the vulnerability, adopting various mitigation strategies and also in making preparation for response and recovery.

I am very glad to know that National Remote Sensing Center (NRSC), ISRO, Hyderabad in association with Odisha State Disaster Management Authority (OSDMA) has prepared the Flood Hazard Atlas for Odisha using satellite based observations during 2001-2018. I hope, the Atlas would be a very useful document for taking up various decisions on flood preparedness in the state.

I compliment all those who have been associated with the preparation of this important document.

**FOREWORD**

Floods and cyclones are one of the major disasters recurrently being faced by India causing huge loss to lives, livelihood and infrastructure. Odisha State is one of the most flood and cyclone affected States in the country. Identification of the flood-prone areas would offer significant clues for the planners for devising and area-specific flood mitigation measures. Satellite Remote Sensing data provides information on inundation for different magnitudes of floods and cyclones with various other land information which could be used for delineating the flood hazard zones.

The Disaster Management Support (DMS) Programme of Indian Space Research Organisation (ISRO), National Remote Sensing Centre (NRSC) has been generating flood and cyclone inundation maps in near real-time using satellite data for all the major flood and cyclone events in the country for more than two decades, and the information being provided to the State Relief / Disaster Management Departments. This has enabled generation of reliable large database on spatial flood inundation patterns and frequency of occurrence especially for Odisha which can be used in preparing flood hazard maps.

NRSC has prepared the satellite based flood hazard atlas for Odisha for the first time in the country. This atlas is prepared using multi-temporal satellite datasets acquired during the last 18 years from 2001 to 2018 covering the Odisha State. I am happy to know that the atlas will be useful to the district administration of Odisha and Government of Odisha for planning and decision making and as a precursor for the flood and cyclone preparedness.

I am confident that the information provided in the atlas will be of great help to the Government of Odisha in flood preparedness, flood risk assessment, planning and implementing necessary long-term mitigation measures for reducing the impact of the flood disasters in the State of Odisha.

Santanu Chowdhury

Director

PREFACE

Flood is the one of the major natural disasters in India that occurs with consistent regularity. It is estimated that on an average almost 40 mha is flood-prone area of the country experiencing floods frequently. Flood Hazard Mapping is a vital component for appropriate land use planning in flood-prone areas. It creates easily-read, rapidly-accessible charts and maps which facilitate the identification of areas at risk of flooding and also helps prioritise mitigation and response efforts. Flood hazard maps are designed to increase awareness of the likelihood of flooding among the public, local authorities and other organisations. They also encourage people living and working in flood-prone areas to find out more about the local flood risk and to take appropriate action

Department of Space (DOS), as the nodal agency for National Natural Resources Management System (NNRMS), has launched a major Disaster Management Support Programme (DMSP) with NRSC as the single window delivery mechanism for providing near-real time products and services using satellite remote sensing data for various phases of disaster management. Preparation of flood inundation maps and assessment of damages has been an ongoing operational activity for more than a decade, thus, enabling creation of reliable, long term database on flood hazards and associated risks.

With above long term data base, National Remote Sensing Centre (NRSC), ISRO has prepared the flood hazard maps for Odisha State using satellite remote sensing data sets, as Odisha is one of the most flood and cyclone affected States in the country. About 100 Indian Remote Sensing (IRS) Satellite and foreign satellite datasets, spanning over 18 years from 2001 to 2018, acquired at different flood magnitudes in Odisha have been used to create the flood hazard maps. The hazard assessment is carried out by considering the spatial extent of inundation and the frequency of flooding as the deciding parameters. The hazard zones were categorized into five classes ranging from Very low hazard zone to very high hazard zone. The maps have been field verified by the respective district administrations of Government of Odisha.

I am sure that information on flood hazard derived from aerospace datasets will be useful to Government of Odisha in taking appropriate mitigation measures during flood and cyclone disasters and for proper land use planning to minimize the flood damage.

Government of India

D N Sharma

Member, National Disaster Management Authority

MESSAGE

National Disaster Management Authority has initiated various programmes to induct science and technology in disaster management in the country with a vision to build a safer and disaster resilient India through a holistic, proactive and technology-driven approach. One such important initiative is to develop upgraded hazard profiles for various natural hazards for their subsequent use in vulnerability analysis and risk assessment.

India is highly vulnerable to floods and out of the total geographical area of 329 million hectares, more than 40 million hectares (12 percent of land) is prone to floods. Floods are a recurrent phenomenon, which cause huge loss of lives and damage to livelihood system, property, infrastructure and public utilities. However, we do not have information of the flood hazard profile at a reasonably large scale and this is a matter of concern.

The initiatives of India Space Research Organization (ISRO) to utilize space - based technology for disaster management are commendable. NDMA entrusted NRSC/ISRO for preparing the flood hazard maps using satellite data for the most flood prone states of the Country on priority. It is being carried out by utilizing the historic satellite imageries of about 2 decades period from the archives of the National Remote Sensing Centre, Department of Space, along with technical assistance from, the various stakeholders and duly validated by the actual observation data of flood inundation areas of the concerned states.

I am extremely happy to note that, after successful preparation of Flood Hazard Atlas for Assam and Bihar, such Atlas for the state of Odisha is being released. I am sure that the Flood Hazard Atlas prepared by National Remote Sensing Centre, ISRO would provide the much needed information for effective and better planning for floods and taking necessary mitigation measures in the Odisha State.

MESSAGE

Floods are a regular phenomenon in Odisha happening almost every year causing huge loss of lives and property. The State has witnessed numerous floods during the last two decades. I appreciate the efforts of National Remote Sensing Center (NRSC), ISRO, Hyderabad for taking up the study on flood hazard zonation for Odisha using satellite data for the period 2001-2018. The study is one of the most important non-structural measures, which facilitates appropriate regulation and development of floodplains thereby reducing the impact.

Multi-date satellite data of the floods have been used for the study. Now-a-days, Satellite remote sensing can provide cost effective crucial information on flood inundated areas for different magnitudes of flood. The District-wise Flood Hazard Atlas for Odisha prepared under the study would help the disaster managers to address the flood management – related issues more judiciously and efficiently.

It is mentioned in the National Guideline on Management of Floods published by NDMA , Govt. of India that, each and every flood event must be properly documented and flood damage assessment be made on scientific basis using the latest technological advancements in the field of remote sensing through satellites etc. I think, this atlas would be in line with the national guideline which would give a proper assessment of Flood inundated areas.

No doubt, continuous efforts have been made over the years in the State to reduce the damages due to floods and mitigate the sufferings of the people. There are still many challenges which need to be addressed for better preparedness for flood situations. This atlas would give a new dimension for taking up various flood preparedness measures in the state.

I thank NRSC and OSDMA for their efforts in preparing the Flood hazard Atlas. I hope this Atlas will prove to be a milestone in moving towards a safer and resilient Odisha.

(A. P. PADHI)

Bishnupada Sethi, IAS

Commissioner-cum-Secretary, Disaster Management
Special Relief Commissioner, Odisha &
Managing Director, Odisha state Disaster Management Authority

Foreword

Floods in Odisha are regular features which happen almost every year. The vast areas of state are inundated due to the floods in major rivers namely, Mahanadi, Brahmani, Baitarani, Subarnarekha and Rushikulya. Some of the rivers like Vamsadhara and Budhabalanga also cause flash floods due to instant run-off from their hilly catchments. The recurrent flood events at frequent intervals demand for identification of flood hazard prone areas in a scientific way for prioritizing appropriate flood preparedness and long term planning.

In the recent years, the focus of disaster management is increasingly moving on to more effective utilization of emerging technology such as Remote Sensing, Geographic Informatics System (GIS) and satellite communication. As per the National Guidelines on Management of Floods by NDMA, Government of India, flood assessment needs to be made on a scientific basis. The recent development in space technology has a tremendous potential to address the critical information needs during all the phases of disaster management.

The efforts of National Remote Sensing Centre (NRSC), ISRO, Hyderabad on providing near real time flood inundation information on the basis of satellite data are highly appreciated. The flood inundation information is quite useful and being utilized for relief management in the state. The information received from NRSC get customized at OSDMA and used for relief and rescue operations in the past floods.

The Flood Hazard Atlas prepared by the NRSC is an endeavor towards the management of floods in the state. The flood hazard atlas has been prepared on the basis of historic flood inundation captured through satellite imageries over a period from 2011 to 2018 and the methodology adopted for arriving at the district-wise flood hazard index. It provides information on the areas of specific hazard zones which would help prioritizing mitigation and response efforts. In the longer-term, flood hazard maps can support the planning process and development by identifying high risk locations in a sustainable manner.

I am grateful to the NRSC for their efforts to bring out such a useful document which would give new dimensions towards the flood management and also taking up various flood preparedness measures in the state. Flood hazard maps are designed to increase awareness of the likelihood of flooding and inundation extent among the public, local authorities and other organizations. I hope this Atlas will serve as a useful resource of information for policy makers, planners, civil society group and all those who are involved flood management in the state.

Bishnupada Sethi
15.2.2019
(Bishnupada Sethi)

ACKNOWLEDGEMENTS

The project team would like to place on record our deep sense of gratitude to Dr. K Sivan, Chairman, Indian Space Research Organisation (ISRO) and Secretary, Department of Space for evincing keen interest in DMS Programme and identifying NRSC as single window delivery mechanism for providing satellite and aerial based products and services for Disaster Management Support programme in the country.

The Project team sincerely thanks Dr. D N Sharma, Member-NDMA for his support, encouragement, and constant persuasion in executing with the project.

The project team expresses sincere thanks to Shri Santanu Chowdhary, Director, NRSC for his constant encouragement, guidance, and for providing necessary support during execution of the project.

The project team conveys earnest thanks to Dr. P G Diwakar, Director, EDPO, ISRO Headquarters, Bengaluru, and Dr. V Bhanumurthy, Associate Director, NRSC, Hyderabad for their valuable guidance and support during the execution of the project. The project team also expresses sincere thanks to Dr. B. P. Shantanu, AD, EDPO, ISRO for constant support and guidance during the project.

The team sincerely thanks former Directors of NRSC Dr. V K Dadhwal and Dr. Y V N Krishna Murthy for their guidance and support during execution of the project.

The project team convey earnest thanks to Shri Bishnupada Sethi, Managing Director, OSDMA for his continuous support and guidance. Thanks are due to the Odisha State Project Officers and District Administration of Odisha for carrying out the ground validation of the flood hazard maps. Special thanks to Odisha State Disaster Management Authority (OSDMA), Government of Odisha, for ensuring initiation and validation of the maps and content besides their active involvement in finalising the atlas.

Finally all the individuals of NRSC who are involved either directly or indirectly in completion of this task are duly acknowledged.

Project Team, NRSC

1.0 INTRODUCTION

1.1. FLOOD AND ITS SEVERITY

Flood is one of the most severe disasters affecting the people across globe. India, on account of its geographical position, climate and geological setting, is the worst affected centre of disaster in the South-Asian region, making it vulnerable to many natural hazards, particularly to floods. India is the worst flood-affected country in the world after Bangladesh and accounts for one-fifth of global death count due to floods. Nearly 75 per cent of the total Indian rainfall is concentrated over a short monsoon season of four months (June-September). As a result, the rivers witness a heavy discharge during these months, leading to widespread floods. About 40 million hectares of land in the country is liable to floods according to National Flood Commission, and an average of 18.6 million hectares of land is affected annually. The annual average cropped area affected is approximately 3.7 million hectares. The most flood-prone areas in the country are the Brahmaputra, Ganga and Meghna River basins in the North and North-east India. Table-1 shows the extent of flood damages incurred during 1953-2005 in India.

FACTORS CAUSING FLOODS

Inadequate capacity of the rivers to contain the high flows brought down from the upper catchment due to heavy rainfall, leads to flooding. Areas having poor drainage characteristic gets flooded by accumulation of water from heavy rainfall. Excess irrigation water applied to command areas and increase in ground water level due to seepage from canals and irrigated fields accentuate the problem of water logging. Flooding is accentuated by erosion and silting of the riverbeds resulting in reduction of carrying capacity of river channel, leading to changes in river courses & obstructions to flow due to landslides, synchronization of floods in the main and tributary rivers and retardation due to tidal effects. With the increase in population and developmental activity, there has been a tendency to occupy the flood plains, which has resulted in more serious nature of damage over the years. Because of the varying rainfall distribution, many a times, areas which are not traditionally prone to floods also experience severe inundation. Thus flood is the single most frequent disaster faced by the country. Floods have different dimensions, inundation due to spills over the banks, drainage congestion due to poor drainage characteristics, erosion due to changes in river course etc. Fig 1 shows the the field photograph of the flood situation in Kendrapara district of Odisha state during the cyclone phailin floods of 2013.

1.2. MANAGING FLOODS

In India, systematic planning for flood management commenced with the Five Year Plans, particularly with the launching of National Program of Flood Management in 1954. During the last 48 years, different methods of flood protection, structural as well as non-structural have been adopted in different states depending upon the nature of the problem and local conditions.

In order to mitigate the impact of floods appropriate flood management measures have to be implemented. These measures can be classified into;

1. Structural measures
2. Non-structural measures

Structural Measures

In this approach physical structures are envisaged to prevent the flood waters from reaching potential damage centers. The main structural measures undertaken so far in India are as follows.

1. Embankments, Floodwalls, Flood levees
2. Dams and Reservoirs
3. Natural Detention Basin
4. Channel Improvement
5. Drainage Improvement
6. Diversion of flood water
7. Catchment area treatment/ afforestation
8. Anti-erosion works

The various flood management measures undertaken through the successive five year plans are summarized in table-2.

Table-2: Flood management measures undertaken during various five year plans

S No	Type of Flood Control Works	Extent
1	Flood Embankments	34397.61 km
2	Drainage Channels	51317.50 km
3	Town protection works	2400 Nos.
4	Villages raised.	4721 Nos.

(Source: Report of Working Group on Flood Management and Region Specific Issues for XII Plan)

Reservoirs constructed with exclusive flood control storage include Maithon, Panchet, Tilaiya and Konar in Damodar Valley; Chandil dam on Subarnarekha river, Hirakud dam on Mahanadi river and Rengali dam on Brahmani river. In addition, a live storage of 177 billion cubic meters created so far in the various reservoirs for irrigation, hydropower generation, drinking water etc. also help in reducing flood intensity by storing part of the flood waters in them. The flood management measures undertaken so far have provided reasonable degree of protection to an area of 15.81 million hectares through out the country. State-wise break-up of the flood control works undertaken are provided in Table-3.

Table-3: State-wise break-up of the flood control works

(Source: Report of Working Group on Flood Management and Region Specific Issues for XII Plan)

Sl.No	Name of State	Area benefited (m.ha.)	Length of embankment (Km)	Length of Drainage channel (Km)	Town/village protected (Nos.)	Villages on raised/ protected (Nos.)

Non-Structural Measures

Non-structural measures strive to keep the people away from floodwater. It contemplates the use of flood plains judiciously. This technique allows the use of flood plains by reducing the disaster dimension, while retaining its beneficial needs. Following are the main non-structural measures

1. Flood plain Zoning
2. Flood Proofing
3. Flood forecasting and warning
4. Regulation of reservoirs
5. Flood Insurance

Central Water Commission (CWC) has established flood forecasting system comprising 175 stations on all major rivers and is implementing the scheme for its modernization and expansion. Ministry of Water Resources (MoWR) and CWC had circulated the draft bill for floodplain zoning regulations to the state governments for enactment and enforcement.

The need to generate flood hazard zonation maps for the country rises from the fact that they are one of the important non-structural measures which can be beneficially used in regulating land use practices and prioritising of relief and rescue operations in the perennially flood hazard affected areas.

1.3. FLOOD HAZARD ZONATION

Flood Hazard Zonation (FHZ) is one of the most important non-structural measures, which facilitates appropriate regulation, and development of floodplains thereby reducing the flood impact. The recurrent flood events at frequent intervals demand the need for identification of flood hazard prone areas for prioritizing appropriate flood control measures.

Hazard indicates the probability of occurrence of a disaster with in a specific period of time and with in a given area of potential damage, such as floods. The problem is more acute and the possible solutions are more complex in the Mahanadi basin mainly because of the "Hexadeltaic region" of the basin and it stretches along the coast of the Bay of Bengal having the maximum width in the Middle Coastal Plain (the Mahanadi Delta), narrow in the Northern Coastal Plain (Balasore Plain) and narrowest in the Southern Coastal Plain (Ganjam Plain).

In recent past, various methods and techniques have been proposed to analyze the causative factors of floods and produce maps portraying the probability of occurrence of similar phenomena in future. Broadly these methods can be classified as direct and indirect methods.

The direct method consists of flood hazard mapping wherein, the past and present flood trends are identified and assumptions are made on the factors leading them, following which, zonation is made of those sites where floods are most likely to occur. The indirect methods includes two different approaches namely the heuristic (Knowledge driven) and statistical (Data driven) techniques. In the heuristic approach, factors influencing floods such as narrowness of the valleys, very high rainfall, and the heavy encroachment of the flood plains and the increasing pressure of population etc. are ranked and weighted according to their assumed or expected importance. This is normally based on *a priori* knowledge available to the experts on various causes of floods in the particular area of investigation.

Conventional flood hazard mapping techniques use historical flood data to map floodplains. In addition to a record of peak flows over a period of years, a detailed survey (cross sections, slopes and close contour maps), maps such as soils, physiography, land use, vegetation, population density, infrastructure, and settlements along with hydraulic roughness estimates is required before the extent of flooding for an expected recurrence interval can be determined. Some of the data required for hazard mapping is difficult to obtain from ground measurements and time consuming. FHZ map requires mainly flow information and fine resolution Digital Elevation Model (DEM) to model. However, fine resolution DEM is not available for most of the floodplains in the country. With these constraints it is difficult to prepare FHZ maps conventionally. In this context, the Earth Observation Satellites provide the synoptic coverage of spatial extent of flooding for major flood events at regular intervals, which helps in identifying the flood inundated areas.

1.4. INITIATIVES OF DEPARTMENT OF SPACE (DoS)

Keeping in view of the demonstrated potential of Earth Observation (EO) and Communication satellites, Department of Space (DoS) has launched Disaster Management Support Programme (DMSP) for providing aerospace information for disaster management to the nation.

Disaster Management Support Programme

In order to provide vital inputs and support in the event of a disaster, Department of Space (DoS), Government of India, has been developing techniques and methodology by integrating space based systems and services for disaster management. DoS had executed a Disaster Management Support Programme (DMSP) for integrating operationally the space technology inputs and services on a reliable and timely basis for strengthening India's resolve towards disaster management. DMS Programme addresses five issues mainly (i) creation of digital database at appropriate scales for facilitating hazard Zonation, damage assessment, etc., in perennially disaster prone areas, (ii) development of appropriate Remote Sensing & Geographical Information System (GIS) based decision support tools and techniques and demonstrations catering to the information needs at different levels, (iii) acquisition of close contour information for priority areas, (iv) strengthening the communications backbone for addressing the real time / near real time information transfer needs and (v) networking of scientific institutions for exchange of data, information and knowledge.

Towards enabling the operational services, a Decision Support Centre (DSC) is established at National Remote Sensing Centre, (NRSC), Hyderabad, as a single window provider, interfacing with the National / State disaster management agencies. The important components of the DSC include satellite/ aerial data acquisition strategy, user required information and formats, output generation, dissemination of information generated to the users through networking, support functions such as digital database, query shells, hazard zonation, etc.

Remote Sensing of Floods

Remote sensing makes observation of an object from a distance without being into physical contact. Remote sensing technique can gather data much faster than ground-based observation and can cover large areas at a time to give synoptic view. Remote sensing comprises of aerial remote sensing which is the process of recording information, such as photographs and images from sensor onboard aircrafts and satellite remote sensing which consists of several satellite remote sensing systems.

Satellite remote sensing technology has made substantial contribution in every aspect of flood disaster management such as preparedness, prevention and relief. Space systems from their vantage position have unambiguously demonstrated their capability in providing vital information and services for flood management (U R Rao, 1994). Satellite remote sensors cover wide area, periodicity and spectral characteristics and especially in the easiness to compare the data before and after flood disaster. The Earth Observation satellites provide comprehensive, synoptic and multi temporal coverage of large areas in near real time and at frequent intervals and thus have become valuable for continuous monitoring of atmospheric as well as surface parameters related to natural disasters. Geo-stationary satellites provide continuous and synoptic observations over large areas on weather including cyclone monitoring. Polar orbiting satellites have the advantage of providing much higher resolution imageries, even though at low temporal frequency, which could be used for detailed monitoring, damage assessment and long-term relief management. Remote sensing also allows monitoring of flood events during the time of occurrence while floods are at peak. Presence of clouds can hamper optical satellite observations of floods during monsoon season. Microwaves, which has got all weather capability helps under these circumstances. Synthetic Aperture Radar (SAR), a microwave sensor aboard RISAT-1 Radarsat and Sentinel series satellites helped in achieving the regular observation of the earth's surface, even in the presence of cloud cover. SAR images are also particularly good at identifying open water - which looks black in most images. When combined with optical and infra-red sensors from other satellites, an extremely accurate and detailed digital map can be created complimented by ground truth.

During last two decades satellite remote sensing has been operationally used for flood disaster management in India. The potential use of remote sensing technology for flood disaster management can be as follows:

- Flood inundation mapping and monitoring
- Rapid and scientific based damage assessment
- Monitoring and mapping of flood control works and changes in the river course
- Identification of river bank erosion
- Identification of chronic flood prone areas
- Improvement in flood forecasting & warning models

High-resolution sensor technology has provided immense scope to the earth resource scientists world-wide for mapping and analysing details of earth surface features using Remote Sensing and Geographic Information Systems (RS & GIS). The Table-4 provides list of frequently used satellites and sensors for flood management in India.

Table-4 Frequently used satellites and sensors for flood mapping in India

S No	Satellite	Sensor	Spatial Resolution (in meters)
1	IRS-1C & 1D	WiFS	188
		LISS-III	23.5
		PAN	5.8
2	IRS-P6 / Resourcesat-2	AWiFS	56
		LISS-III	23.5
		PAN/L4-MX	5.8
3	IRS-P5	PAN	2.5
4	RISAT-1	SAR	50/25
5	RADARSAT-1/2	SAR	100/50
6	SENTINEL-1	SAR	10 m

(Source: NRSC, ISRO)

Thus satellite data can be directly used for deriving the flood inundation extents. With remote sensing technology, the extent of floodplains and flood-prone areas can be approximated over entire river basins. Flood inundation and floodplain maps have been prepared from satellite data by hydrologists all over the world. This technique is capable of yielding useful information for flood hazard assessment. If satellite data sets during flood times are available over a period of time for a floodplain, they can be conveniently used for hazard zone mapping. In addition, latest landuse/land cover, infrastructure, settlements, etc. can also be generated from satellite data. Fig-2 & 3 shows the pre-flood and during-flood IRS satellite data over Odisha. Blue colour indicates the water, while red colour indicates vegetation and white colour indicates cloud cover, in these images.

Fig 2: IRS Satellite image showing the pre-flood situation in Odisha State

Fig 3: IRS Satellite image showing the flood situation in Odisha State

2.0 FLOODS IN ODISHA

2.1. ABOUT ODISHA

Odisha is located between the parallels of 17⁰.49' N and 22⁰.34' N latitudes and meridians of 81⁰.27' E and 87⁰.29' E longitudes. It is bounded by the Bay of Bengal on the East; Chhattisgarh on the West, Jharkhand and West Bengal on the North and Andhra Pradesh on the South. It has a coast line of about 480 km. It extends over an area of 1,55,707 square km covering about 4.87% of the total area of India. According to the 2011 census, it has a total population of 4,19,47,358 (3.73% of the total population of India) out of which about 2,12,01,678 are men and 2,07,45,680 are women. The State is broadly divided into four geographical regions viz. the Northern plateau, Central river basins, Eastern hills and Coastal plains. The Northern plateau region comprises mainly Mayurbhanj, Keonjhar and Sundargarh districts. The Central river basins lie between the northern plateau and eastern hills and include Bolangir, Sonepur, Sambalpur, Deogarh, Baragarh, Jharsuguda, Dhenkanal & Anugul districts and a part of Cuttack district. The Eastern hills which constitute the last portion of the Eastern Ghats, lie to the south and southwest of central river basins stretching for about 250 km in northeast – southwest direction through the districts of Koraput, Rayagada, Nabarangpur, Malkangiri, Kalahandi, Nuapada, Gajapati and a part of Ganjam district. The eastern hills are elevated and are generally 900 m above sea level. The coastal plains comprise mostly of Balasore, Bhadrak, Kendrapada, Jagatsinghpur, Jajpur, Puri, Khordha, Nayagarh districts and a portion of Ganjam and Cuttack districts. The areas of the state north of latitude 20°N have elevation up to 500m above sea level in general and in the south western districts, they rise to 1500-1600m above sea level.

2.1.1. Administrative Setup

Odisha is divided into 30 administrative districts. Table-5 shows the various districts and their headquarters.

Table-5: Districts in Odisha state and their details
(Source: Census of India, 2011)

Sl.no	Name of District	Headquarters
1	Angul (Anugul)	Angul
2	Baleswar (Balasore)	Balasore
3	Bargarh (Baragarh)	Bargarh
4	Bhadrak	Bhadrak
5	Bolangir (Balangir)	Balangir
6	Boudh (Bauda)	Boudh
7	Cuttack	Cuttack
8	Debagarh (Deogarh)	Debagarh
9	Dhenkanal	Dhenkanal
10	Gajapati	Paralakhemundi
11	Ganjam	Chhatrapur
12	Jagatsinghpur	Jagatsinghpur
13	Jajapur (Jajpur)	Jajapur
14	Jharsuguda	Jharsuguda
15	Kalahandi	Bhawanipatna
16	Kandhamal	Phulbani
17	Kendrapara	Kendrapara
18	Kendujhar (Keonjhar)	Kendujhar
19	Khordha	Bhubaneswar
20	Koraput	Koraput
21	Malkangiri	Malkangiri
22	Mayurbhanj	Baripada
23	Nabarangpur	Nabarangapur
24	Nayagarh	Nayagarh
25	Nuapada	Nuapada
26	Puri	Puri
27	Rayagada	Rayagada
28	Sambalpur	Sambalpur
29	Subarnapur (Sonepur)	Subarnapur
30	Sundargarh (Sundergarh)	Sundargarh

2.1.2. Demography

As per the Census of India 2011, total population of Odisha is 41,947,358. Higher population concentration was recorded in the districts of Ganjam, Cuttack, Mayurbhanj, Baleshwar, Khurdha, Sundargarh and Jajpur. Previously in the 2001 census the total population was 36,804,660. The Population growth since the last ten years was 13.97 percent and the population of the state forms 3.47 percent of the entire population in India. Odisha has an area of 155,707 sq. km with a density of 269 per sq kms. It has a literacy rate of 73.45 percent with male literacy at 82.40 percent and female literacy at 64.36 percent. Table-6 shows the district-wise demographic profile of Odisha. Figures -4 & 5 show the population growth trend and district-wise literacy rate of Odisha state.

Table-6: District-wise demographic profile of Odisha, 2011
(Source: www.mapsofindia.com/census2011/odisha-sex-ratio.html)

Sl. No.	District	Area (Sq. Km.)	Population	Male Population	Female Population	Growth	Sex ratio (female per 1000 males)	Percentage of literacy	Density per Sq. Km.

2.1.3 Physiography

Morphologically the state of Odisha can be broadly divided into five major regions. The coastal plains in the East, the middle mountainous and highlands region of north and northwest, the central plateaus, the Western rolling uplands and the major flood plains.

- **The Odisha Coastal Plains**

The Odisha Coastal Plains are the depositional landforms of recent origin and geologically belong to the Post-Tertiary Period. The 75 meter contour line delimits their western boundary and differentiates them from the Middle Mountainous Region. This region stretches from the West Bengal border, i.e. from the River Subarnarekha in the north to the River Rushikulya in the south.

This region is the combination of several deltas of varied sizes and shapes formed by the major rivers of Odisha, such as the Subarnarekha, the Budhabalanga, the Baitarani, the Brahmani, the Mahanadi, and the Rushikulya. Therefore, the coastal plain of Odisha is called the "Hexadeltaic region" or the "Gift of Six Rivers". It stretches along the coast of the Bay of Bengal having the maximum width in the Middle Coastal Plain (the Mahanadi Delta), narrow in the Northern Coastal Plain (Balasore Plain) and narrowest in the Southern Coastal Plain (Ganjam Plain). The North Coastal Plain comprises the deltas of the Subarnarekha and the Budhabalanga rivers and bears evidences of marine transgressions. The Middle Coastal Plain comprises the compound deltas of the Baitarani, Brahmani and Mahanadi rivers and bears evidences of past 'back bays' and present lakes. The South Coastal Plain comprises the lacustrine plain of Chilika lake and the smaller delta of the Rushikulya River.

- **The Middle Mountainous and Highlands Region**

The region covers about three-fourth of the entire State. Geologically it is a part of the Indian Peninsula which is a part of the ancient landmass of the Gondwanaland. The major rivers of Odisha with their tributaries have cut deep and narrow valleys. This region mostly comprises the hills and mountains of the Eastern Ghats which rise abruptly and steeply in the east and slope gently to a dissected plateau in the west running from north-east (Mayurbhanj) to north-west (Malkangiri). This region is well marked by a number of interfluvies or watersheds. The Eastern Ghats is interrupted by a number of broad and narrow river valleys and flood plains. The average height of this region is about 900 metres above the mean sea level.

- **The Central Plateaus**

The plateaus are mostly eroded plateaus forming the western slopes of the Eastern Ghats with elevation varying from 305-610 metres. There are two broad plateaus in Odisha : (i) the Panposh - Keonjhar -Pallahara plateau which comprises of the Upper Baitarani catchment basin, and (ii) the Nabrangpur - Jeypore plateau which comprises of the Sabari basin.

- **The Western Rolling Uplands**

These are lower in elevation than the plateaus having heights varying from 153 metres to 305 metres.

- **Rivers**

There are four groups of rivers which flow through Odisha into the Bay of Bengal .They are :

- (i) Rivers that have a source outside the State (the Subarnarekha, the Brahmani and the Mahanadi).
- (ii) Rivers having a source inside the State (the Budhabalanga, the Baitarini, the Salandi, and the Rushikulya).
- (iii) Rivers having a source inside the Odisha, but flow through other states (the Bahudu, the Vansadhara, and the Nagavali).
- (iv) Rivers having a source inside Odisha, but tributary to rivers which flow through other states (the Machkund, the Sileru, the Kolab, and the Indravati).

2.1.4 Climate

The climate of the state is characterized by hot summer and cold winter in the interior. The climate of the coastal region near the Bay of Bengal is moist equable. The State can be divided into ten agro-climatic zones on the basis of soil, weather and other relevant characteristics. Its land can be classified into three categories, low (25.6%), medium (33.6%) and up-lands (40.8%) with various types of soil like red, yellow, red loamy, alluvial, coastal alluvial, laterite and black soil, etc. with low and medium texture. Characteristics of different agro-climatic zones in Odisha are presented in following table 7.

The year may be divided into four seasons. The winter season from December to February is followed by the pre-monsoon or hot weather season from March to May. The period from June to September constitutes the southwest monsoon season and the period of October and November is the post-monsoon season. During the period from December to February, generally low temperatures prevail over the state except in the coastal belt. In the hot weather season from March to May, weather is generally dry and uncomfortable in the interior, while due to lower temperatures, the plateau regions are, comparatively less uncomfortable. Weather tends to be oppressive during July due to high humidity and high temperature. The rest of the period of the monsoon is fairly comfortable due to reduced day temperatures, although humidity continues to be high.

Table-7: Climatic zones and Rainfall of Odisha

Sl. No.	Agro-climatic Zone	Climate	Mean Annual Rainfall (mm)	Soil group
1	North western plateau	Hot and moist	1648	Red and Yellow
2	North central plateau	Hot and moist	1535	Red loamy
3	North eastern coastal plateau	Hot and moist sub-humid	1568	Alluvial
4	East and south eastern plateau	Hot and humid	1449	Coast alluvial saline (near the coast line)
5	North eastern ghat	Hot and moist sub-humid	1597	Laterite and brown forest
6	Eastern ghat high land	Warm and humid	1522	Red
7	South eastern ghat	Warm and humid	1522	Red, mixed red and yellow
8	Western undulating	Warm and moist	1527	Black, mixed red and black
9	West central table land	Hot and moist	1527	Red, heavy textured colourous
10	Mid central table land	Hot and dry sub-humid	1421	Red loamy, laterite mixed red and black.

(Source: OSDMA. State disaster management plan, Aug,2013)

2.1.5 Major Rivers

All the rivers of Odisha are primarily peninsular rivers and have originated from (a) the Chhota Nagpur plateau in Jharkhand, (b) the Amarkantak plateau in Chattisgarh, or (c) the Eastern Ghats within Odisha. All these rivers are non-perennial in character. The main rivers in the state include:

Rivers originating from Chhotanagpur plateau: These include Subarnarekha and Brahmani. While Subarnarekha's stretch within Odisha is small, Brahmani and its tributaries form an important drainage sub-system in Odisha.

Rivers from the Amarkantak plateau: The Mahanadi and its tributaries (25 on the right bank and 2 on the left bank, more important among which are the Tel, the Jira and the Jhaun) form the largest drainage sub-system on the central eastern coast of India. The Mahanadi is divided into a series of distributaries and sub-distributaries.

Rivers originating in the Mahanadi delta: There are seven such rivers (the Samolia, the Gobari, the Prachi, the Kadua, the Dhanua, the Ratnachira and the Nuna).

Rivers from Keonjhar: The Baitarani, which has a total length of 344 km, with the tributaries, such as the Deo and the Indrani, forms a major drainage sub-system in Odisha. A peculiar feature of Baitarani is that in its lower reaches, it drains into the distributaries of the Brahmani, and has a common mouth to the Bay of Bengal at Dhamra.

Rivers from the eastern slopes of the Eastern Ghats: These rivers include the Budhabalanga, the Salandi, the Rushikulya and several other smaller streams.

Tidal Sections of the Rivers: The tidal sections of rivers and their distributaries are confined to the lower reaches of the rivers in the coastal plain. The tidal sections vary as per the shape of the river mouth, depth of the channel, and extension of the sand bars in the river mouths. The tidal channels vary from a maximum of 90 km in the case of Brahmani to a minimum of 5 km in the case of Baghuni from their respective mouths. The Mahanadi is tidal for about 35 km, whereas the Devi, a distributary of the Mahanadi is tidal for 45 km.

River Mahanadi

It is the major river of Odisha and the sixth largest river in India. It originates from the Amarkantak hills of the Bastar Plateau in Raipur district of Madhya Pradesh. It is about 857 kms. Long (494 kms. In Odisha) and its catchment area spreads over 141,600 sq.kms. (65,580sq.kms.) in Odisha). The river carries on an average about 92,600 million m of water.

The Brahmani

It is the second largest river in Odisha. It originates as two major rivers like the Sankh and the Koel from the Chhotanagpur Plateau of Bihar and both join at Veda Vyasa near Rourkela of Sundargarh district of Odisha forming the major River Brahmani. It flows through the Eastern Ghats in Sundargarh, Kendujhar, Dhenkanal, Cuttack and Jajpur districts into the Coastal Plains and enters into the Bay of Bengal along with a combined mouth with the Mahanadi known as the Dhamra. The Brahmani is 799 kms. Long (541 kms. In Odisha) and its catchment area spreads over 39,033 sq.kms. in Odisha).

The Baitarani

It originates from the Gonasika hills of the Kendujhar district. It is 365 kms long and its catchment area spread over 12,790 sq. kms. It enters into the Bay of Bengal after joining the Brahmani at Dharma mouth near Chandabali.

The Subarnarekha

It originates from the Chhotanagpur plateau of Bihar. It is 433 kms long (70kms in Odisha) and has a catchment area of 19,500 kms (3,200 kms in Odisha) with a mean annual flow of 7,900 million m.

The Budhabalanga

It originates from the eastern slopes of the Simlipala massif. It is about 175 kms long having a total catchment area of 4840 sq. kms with an annual flow of 2177 million m. Its major tributaries are the Sone, the Gangadhar, the Catra etc.

The Rushikulya

It originates from the Rushyamala hills of the eastern ghats in Phulbani district. It is 165 kms long with 8900 sq. kms of catchment areas. Its tributaries are the Baghua, the Dhanei, Badanadi etc. It has no delta at its mouth.

The Bahuda

It originates from the Ramgiri hills of the eastern ghats in Gajapati districts and joins the Bay of Bengal in Andhra Pradesh. Its length is 73 kms and has a catchment area of 1250 sq. kms.

The Bansadhara

It originates from the flanks of the Durgakangar hills (Lingaraj hills) of the eastern ghats in Kalahandi districts. It is 230 kms long out of which only 150 kms flows in Odisha. It enters into the Bay of Bengal at Kalingapatnam in Andhra Pradesh. It has a catchment area of 11500 sq. kms.

The Nagabali

It originates from the Bijipur Hills of the eastern ghats near Lanji garah . It is 210 kms long out of which 100 kms is in Odisha. It has a total catchment area of about 9410 sq. kms.

The Salandi

It originates from the Meghasani Hills of the Similipala massif in Kendujhar district. It is 144 kms long with a catchment area of 1793 sq. kms .

The Indirabati

It originates from the eastern ghats in Kalahandi district. It is 530 kms long with a catchment area of 41700 sq. kms as a tributary it flows into the Godavari river.

The Kolab

It originates from the Sinkaran hills of the eastern Ghats in Koraput district. It has a catchment area of 20400 sq. kms .

2.2. History of Floods & Cyclones - Odisha State

Amongst all the natural disasters afflicting the State, floods are the most frequent and devastating. Almost 80% of the annual rainfall is concentrated over a short monsoon period of 3 months. While the coastal plains are very flat, the slopes in the inlands are precipitous. This leads to heavy siltation, flash floods and poor discharge of flood waters into the sea and thus the embankments are breached with alarming frequency.

In Odisha, damages due to floods are caused mainly by the Mahanadi, the Brahmani and the Baitarani, which have a common delta where floodwaters intermingle, and, when in spate simultaneously, wreak considerable havoc. The problem is further accentuated when flood synchronises with high tide. The silt deposited constantly by these rivers in the delta areas raises the bed levels and the rivers often overflow their banks or break through new channels causing heavy damages. Floods and drainage congestion also affect the lower reaches along the Subarnarekha River. Rivers Rusikulya, Vansadhara and Budhabalanga also cause occasional floods. The entire coastal belt is prone to storm surges, which is usually accompanied by heavy rainfall, thus making the estuary region vulnerable to both storm surges and river flooding. Few districts in the western part of Odisha are prone to flash floods.

Odisha has witnessed two devastating cyclones, during 2013 Cyclone "PHAILIN" and Cyclone "TITLI" during 2018. Cyclone Phailin has caused extensive damage to crops and infrastructure and was categorised as Very Severe Tropical Cyclone by India Meteorological Department, Government of India.

2.2.1 Floods-2006

One or other calamities like flood, cyclone or drought occur every year in Odisha and bring in its trail much loss and sufferings to the people and the state. Needless to say that the impact of recurring disasters had negated the effect of developmental progress considerably and put the coping mechanism of its people into severe strain. Such scenarios can be felt from successive floods from 2006 to 2008.

Due to flood/heavy rain 245 Blocks, 3574 GPs, 18912 Villages, 67.39 lakh Population and 4.90 lakh hectare crop areas of the State were affected. 105 persons lost their lives due to flood/heavy rain. 28,327 hectares of crop area were under sand cast due to the floods.

Damages

Due to occurrence of series of depressions over Bay of Bengal, heavy to very heavy rainfall was experienced over all catchments of all river systems during July & August. As a result, floods occurred in all major rivers causing damages to life & properties in 27 districts as shown in Table-8.

Table 8 : shows the damages incurred during floods-2006

No. of District Affected	27
No. of Blocks Affected	245
No. of GP Affected	3574
No. of villages Affected	18912
No. of ULB Affected	73
Crop Area affected (in lakh hectare)	4.65
Population affected (in lakh)	67.39
Human live lost	105
Livestock lost	1656
No. of houses damaged	130460

(Source : OSDMA, Govt. of Odisha)

2.2.2. Floods- 2007

Due to continuous heavy downpour over upper & lower catchments of river Subarnarekha, Jalaka, Baitarani, Budhabalanga and their tributaries from 4th to 6th July, 2007, floods brought havoc in five districts namely Balasore, Bhadrak, Jajpur, Keonjhar and Mayurbhanj in the first week of July. Storm surge and saline inundation affected parts of Kendrapara district during the said period.

Heavy rainfall was experienced during the last week of June, due to deep depression over the Bay of Bengal affecting the districts of Koraput, Kandhamal, Nayagarh, Ganjam, Sundargarh and Angul.

Peak floods Odisha - 2007

During August & September, 2007 all the coastal districts had received heavy to very heavy rainfall due to deep depression over North West Bay of Bengal during August and September. All catchments of major rivers of Southern and Northern Odisha received heavy rainfall from 5th to 7th August, 2007 & 23rd to 26th September, 2008. As a result, rivers Bansadhara, Baitarani, Subarnarekha, Badanadi, and Budhabalanga were in spate. Similarly, the entire North Odisha was completely submerged by the floods.

Damages

The damages during the July-September floods of 2007 are shown in Table 9.

Table 9: shows the damages due to floods during July-Sep, 2007 (Source : OSDMA, Govt of Odisha)

Damages	July	August	Sept
No. of District Affected	12	15	10
No. of Blocks Affected	46	100	66
No. of GP Affected	304	952	969
No. of villages Affected	1865	4865	5677
No. of ULB Affected	5	20	12
Crop Area affected (in lakh hectare)	1.21	1.97	
Population affected (in lakh)	13.32	22.47	42.35
Human live lost	32	20	39
Livestock lost	19495		
No. of houses damaged	27810		76902

Loss Assessment for July Floods

The total loss to various sectors due to floods/ heavy rain in July was **Rs.306.70 crore**. The department-wise loss assessment is given below in table 10.

Table 10 : Loss assessment damages due to heavy rains in July, 2007 (Source : OSDMA, Govt of Odisha)

Sl.No	Department	Amount (Rs. in lakh)
1.	Special Relief Commissioner	1548.685
2.	Women and Child Development	22.72
3.	Agriculture	1751.01
4.	Fishery and Animal Resources Development	566.39
5.	Handloom & Textile	36.55
6.	Housing and Urban Development	1640.39
7.	Health and Family Welfare	147.65
8.	Rural Development	3967.75
9.	Panchayati Raj	9665.14
10.	Water Resources	8529.64
11.	Works	2045.71
12.	School and Mass Education	389.58
13.	Energy	358.44
Total		30669.655

2.2.3. Floods-2008

The State of Odisha was ravaged by floods in June and September during the year 2008. The unprecedented floods occurred during June and September 2008. The floods of June and September 2008 were of rare severity. The water levels recorded in the Subarnarekha exceeded all the past records. The floods in June 2008 brought havoc in districts namely Balasore, Bhadrak, Jajpur, Mayurbhanj and Keonjhar. Since floods in June 2008 did not allow us any breathing gap, the State experienced a devastating flood in the Mahanadi River System in September 2008.

The floods in September 2008 was due to heavy rainfall in the upper as well as in lower catchments of the Mahanadi River System resulting out of the effect of a deep depression in the Bay of Bengal from 16th to 21st September 2008. The magnitude and severity of the flood in this system has even surpassed the ferocities of 1982 and 2001 floods which were known to be greatest floods in the system.

The Ministry of Home Affairs, Government of India had reported the floods of September'08 as an “**Unprecedented Flood Situation**” on 20th September 2008, vide their letter No.11011 / 2008 MHA-DM-I Dt.20.09.08.

Extent of Damages

During September, 19 districts namely Anugul, Baragarh, Bhadrak, Balangir, Baudh, Cuttack, Gajapati, Jagatsinghapur, Jajpur, Kalahandi, Kendrapara, Keonjhar, Khordha, Nayagarh, Puri, Rayagada, Sambalpur, Nuapada and Subarnapur were seriously affected. In total, the affected Districts come to 21. The severity of September flood was considered to be at par with the floods of 1982. Table 11 shows the damages of floods 2008.

Table 11 : Damages due to floods during June & September, 2008. (Source: OSDMA, Govt of Odisha)

Damages	September	June
No. of Districts affected	19	6
Blocks affected	145	25
GPs affected	1880	277
Villages affected	8026	1768
ULBs affected	29	9
Population affected (In lakh)	45.23	14.94
Human lives lost	96	14
Houses damaged	212965	45,190

2.2.4. Flood – 2009

Table 12: Flood incurred damages during 2009 (Source: OSDMA, Govt of Odisha)

1.	No. and name of the districts affected	15 (Balasore, Bhadrak, Cuttack, Ganjam, Jajpur, Kalahandi, Kandhamal, Kendrapada, Keonjhar, Khurda, Koraput, Nayagarh, Puri, Subarnapur & Sundergarh)
2.	No. of villages affected	1451
3.	Population affected	3.94 lakh
4.	No. of human lives lost	56
5.	Crop Area affected	1.29 lakh hectare
6.	No. of houses damaged	12547 (Fully – 870, partially – 11677)
7.	No. of persons evacuated	62200
8.	No. of boats deployed for evacuation	90
9.	No. of relief camps opened	80
10.	No. of persons accommodated in relief	64346 camps

2.2.5. CYCLONE “PHAILIN”

The Very Severe Cyclonic Storm (VSCS) “PHAILIN” hit Odisha coast on 12.10.2013 and the landfall point was Gopalpur in Ganjam District. The wind velocity was recorded to be 205-220 kmph as shown in fig 6. After hitting the Gopalpur coast, the cyclonic storm with tidal waves of 3.0 to 3.5 meter height ravaged the coastal districts of Ganjam, Puri, Khordha, Jagatsinghpur and Kendrapada. Apart from the coastal districts, the adjoining districts namely, Gajapati, Nayagarh, Keonjhar, Kandhamal, Koraput, Mayurbhanj, Bhadrak, Balasore, Jajpur, Cuttack, Bolangir and Anugul, have also been seriously devastated by this Very Severe Cyclonic Storm and the resultant flood in some districts. The cyclone was accompanied with torrential rains for 3 days, leading to floods in a number of major rivers. Incessant rains and floods with high winds has also caused serious damage to other districts of the State.

In Ganjam district alone 2,812 villages have been affected. Apart from loss of life, power supply, water supply system, communication systems were totally disrupted and lakhs of people were rendered homeless. Public and private properties, agricultural crops and horticultural plantations have suffered severe damage. All surface communication systems, telecommunication, power supply and water supply were totally disrupted. For the first time after the Super Cyclone of 1999, the State has witnessed a **Very Severe Cyclonic Storm** of rare severity. Following the cyclone, due to heavy rainfall, Baitarani, Budhabalanga, Rusikulya, Subarnarekha and Jalaka rivers witnessed floods/ flash floods affecting the downstream areas of mainly, Mayurbhanj, Balasore, Bhadrak, Keonjhar, Jajpur and Ganjam districts. The wind data (Speed) received from IMD during cyclone is mentioned below in table 13.

Fig 6 : shows the cyclone “phailin” as viewed by IMD.

Table 13 Wind speeds during cyclone “PHAILIN” 2013 (Source: OSDMA, Govt of Odisha)

Sl.No	Places	Date	Velocity of wind in kmph
1	Gopalpur	12.10.2013	214 kmph
2	Puri	12.10.2013	223 kmph
3	Paradeep	12.10.2013	121 kmph
4	Bhubaneswar	12.10.2013	112 kmph
5	Chandbali	13.10.2013	112 kmph
6	Balasore	12.10.2013	84 kmph

Rainfall

Due to the effect of cyclonic storm the State faced torrential rainfall from 9th to 14th October 2013. The cumulative amount of rainfall during this spell was as high as 241.1 mm in Ganjam district. The details of rainfall recorded at various stations are given below table 14.

Table 14 : Rainfall recorded at various stations during Oct 9th-14th, 2013 (Source: OSDMA, Govt of Odisha)

Sl.No	Districts	9 th	10 th	11 th	12 th	13 th	14 th	Total

(Note: The rainfall is recoded at 08.30 AM for the past 24 hours)

Rivers flooding

Due to heavy rainfall from 12th to 14th October 2013, Baitarani, Budhabalanga, Rushikulya, Subarnarekha and Jalaka rivers witnessed floods/flash floods affecting the downstream areas of Bhadrak, Keonjhar, Balasore, Mayurbhanj, Ganjam and Jajpur districts. The water level of rivers is given below in table 15:

Table 15: Water levels of the rivers during 12th to 15th Oct, 2013 (Source: OSDMA, Govt of Odisha)

River	Forecast station	DL	WL	Water Level in Meter			
				12 th	13 th	14 th	15 th

2.2.6. CYCLONE "TITLI" (Source: OSDMA, Govt of Odisha)

The Cyclone "Titli" made landfall at 0430AM on 11th October 2018 between north Andhra Pradesh and south Odisha coast near Palasa of Srikakulam District (AP) as a Very Severe Cyclonic Storm as shown in fig 7. As reported by IMD, the maximum sustained surface wind speed of 140-150 kmph gusting to 165 kmph during landfall. Gopalpur, Odisha reported 102 kmph surface wind speed at 05.30 AM on 11th October. After passing through coast the storm entered into the Gajapati district which is about 18 km from the coastline. It continued in its path for 5 hours in Gajapati district maintaining about 130-140 kmph and gradually weakened in to Severe Cyclonic storm.

The cyclone re-curved its path between Rayagada & Kandhamal district and passed through Nayagarh, Cuttack, Dhenkanal, Jajpur, Bhadrak, Balasore and Mayurbhanj districts of Odisha and entered into the Gangetic West Bengal on 13.10.2018. The coastal and adjoining districts of the state experienced high wind and very heavy rainfall during period 11th to 13th October, 2018.

Rainfall (from 10th to 13th October 2018)

Under the influence of the cyclone, very heavy rainfall occurred in many parts of the state from 10th to 13th October 2018. The cumulative amount of rainfall during this period was as high as 295.8 mm in Gajapati district followed by 292.4 mm in Kandhamal District. The average rainfall of the affected districts recorded from 10th to 13th, October 2018 is indicated below in Table 19. Due to heavy rainfall from 11th to 13th October 2018, Rushikulya, Bansadhara, Baitarani, Budhabalanga and Jalaka rivers witnessed flood situations. The torrential downpour in the upper catchment of Rushikulya River caused serious flood situations in the many blocks of Ganjam district. The highest water level recorded in different Rivers during this period is given below in Table 20:

Table 19: Shows the average rainfall recorded during Oct 10-13, 2018

SI No	District	Rainfall in mm				Total Rainfall in mm
		Oct 10 th	Oct 11 th	Oct 12 th	Oct 13 th	
1	Gajapati	0.0	149.9	145.9	0.0	295.8
2	Kandhamal	0.0	51.2	238.0	3.2	292.4
3	Jagatsinghpur	21.8	114.8	105.8	42.3	284.5
4	Cuttack	5.4	71.7	166.1	26.4	269.6
5	Balasore	2.4	102.1	47.4	86.9	238.8
6	Jajpur	4.1	73.5	96.8	61.9	236.3

3.0. FLOOD HAZARD ZONATION USING REMOTE SENSING

Since floodplains can be mapped, the boundary of the different return period flood is used in floodplain mitigation programs to identify areas where the risk of flooding is significant. Flood hazard maps are used to delineate areas of land which are at risk from flooding up to some extreme limit. Hazard maps show a flood boundary based on different magnitudes of flood with various specific return periods. These maps can be used to regulate developmental activities within the floodplain, so that damages can be minimized.

Conventional flood hazard mapping techniques use historical flood data to map floodplains. In addition to a record of peak flows over a period of years, a detailed survey (cross sections, slopes and close contour maps), maps such as soils, physiography, land use, vegetation, population density, infrastructure, and settlements along with hydraulic parameters are required before the extent of flooding for an expected recurrence interval can be determined. Some of the data required for hazard mapping is difficult to obtain from ground measurements and time consuming; in such cases remote sensing plays an important role.

Satellites provide synoptic and frequent coverage of flood affected areas and thus become valuable for monitoring flood disaster. Thus satellite data can be directly used for deriving the flood inundation limits. If satellite data sets during flood times are available over a period of time for a floodplain, they can be conveniently used for hazard zone mapping. In addition, latest land use/land cover, infrastructure, settlements, etc. can also be generated from satellite data.

3.1 APPROACH

In the present context, a large number of satellite images acquired over 18 years (2001-2018) were used. All satellite data sets were analyzed and flood layers were extracted. All the flood layers corresponding to a year are combined as one inundation layer so that this layer represents maximum flooded area in one year. All such combined flood layers for 18 years were integrated into flood hazard layer representing the observed flood inundated areas with different frequencies.

This layer was integrated with digital database layers of Odisha. The flood inundation represented in different colours indicate varying return period as observed during 2001 to 2018. The road and railway lines were also shown to indicate the probable frequency of flooding they are subjected to. The normal river course and water bodies were also shown in the map.

Further, the layer was also integrated with digital database layers of different districts; these layers include road, rail, village, etc. The details of each of the element subjected to flooding were given district-wise in the following units.

Generation of the Flood hazard zones based on the analysis of multi-temporal satellite data acquired during the floods of 2001-2018. Following are the major steps involved in preparation of flood hazard zonation maps

- **Satellite data Acquisition:** Satellite data from Indian Remote Sensing Satellites (IRS) and microwave satellite data from Radarsat, RISAT-1 & Sentinel-1 series satellite were acquired during the floods of 2001-2018 for Odisha state. The water levels observed at different gauge stations were closely monitored during floods and attempts were made to programme the satellite data during near peak water level situations. Satellite data was also programmed and procured during progression and recession of the flood wave for studying the impact of the flood.
- **Rectification:** The acquired satellite datasets were rectified to a defined projection system for integration with database layers and also to integrate the flood layers for generation of hazard layers.
- **Flood inundation layer:** Using image processing classification algorithms water layer was classified from the satellite data and integrated with the pre-flood river and water bodies layer to extract flood inundation layer.
- **Annual Flood Layer:** The flood inundation layers generated for different flood waves in a calendar year were integrated to generate the maximum flood inundation extent observed in that year. Fig 8 shows extraction of inundation layer.
- **Hazard layer:** The maximum flood inundation layers corresponding to various years (2001-2018) were integrated for assessing the frequency and spatial extent of inundation and subsequent generation of hazard layer. Fig 9 shows generation of flood hazard layer.
- **Database integration:** The hazard layer was further integrated with the database consisting of administrative boundaries, landuse/ land cover, infrastructure, etc. for impact assessment and statistics generation
- **Map Composition:** Flood hazard maps were composed at State, District and Detailed levels comprising of base details and hazard layer.

3.2. SATELLITE DATA USED

Satellite datasets were acquired from different satellites during floods over Odisha State year after year. About 100 satellite data sets were selected for flood hazard zoning spanning for a period of 14 flood years, from 2001 to 2018. Some of the datasets cover full Odisha and some cover part of the state. IRS series optical and microwave datasets from RISAT-1, Radarsat & Sentinel-SAR were used for this study, as they have wider swath. Figs. 8 &9 show the methodology adopted for extraction and generation of flood layer from 2001 to 2018. Fig. 10 shows satellite datasets acquired during the floods of 2001-2018 and Table-23 shows the list of satellite datasets utilized for the analysis of flood hazard zonation.

3.3. FLOOD HAZARD ZONATION SCHEMA

Major floods were reported in Odisha state during 2001-18. The floods were monitored and mapped using both IRS (Resourcesat series) and Microwave SAR datasets of Radarsat, RISAT-1 and Sentinel series of datasets. NRSC has analysed about 100 satellite datasets for deriving the flood hazard layer for Odisha State. The hazard layer represents areas subjected to number of times flooded during last 14 years, such as 14-times flooded, 13-times flooded, etc. In order to assess the flood severity based on the frequency of inundation, the following classification schema was applied as shown in table-24

Table 24: Flood Hazard Classification

Sl.No	Flood Hazard Classification	Number of times / years the area was subjected to flood inundation during 2001-2018
1	Very Low	1 time
2	Low	2-4 times
3	Moderate	5-6 times
4	High	7-9 times
5	Very High	10-14 times (almost every year)

To facilitate better visualisation, the following colour coding scheme has been adopted for different hazard zones based on their frequency of inundation.

	Very Low
	Low
	Moderate
	High
	Very High

3.4 FLOOD HAZARD INDEX

In addition to categorizing the flood hazard zones, an attempt is made to find the severity of flood hazard in various districts, using the following flood hazard index.

Flood hazard Index = $\sum$ Hazard Category (H) x Hazard Area (A)

1. Weightages were given to each category of flood hazard (H) and are shown in Table 25
2. Weightages were also given as per the percentage of flood hazard area (A) in the district as shown in the Table 26
3. Flood hazard index is derived for each district by using above formula

Table 25 Weightage for Flood Hazard category

Hazard Zones	Weightage for Hazard Zones (H)
Very High	5
High	4
Moderate	3
Low	2
Very Low	1

Table 26 Weightage for % Hazard Area

Percentage of District Hazard area	Weightage (A)
0-10 %	1
11-20%	2
21-30%	3
31-40%	4
41-50%	5
51-60%	6
61-70%	7
71-80%	8
81-90%	9
91-100%	10

3.5 CROPPED AREA UNDER VARIOUS FLOOD HAZARD ZONES

The cropped area (consisting of kharif, rabi, Zaid & double/triple crop categories) was extracted from the landuse / land cover information (generated under ISRO-NRC project using 2014-15 satellite data) and integrated with the various flood hazard categories.

3.6 LIMITATIONS

The flood hazard zonation was carried out with available satellite datasets of NRSC. The satellite coverage may not correspond to the peak flooding in all cases. Further, all river gauge stations need not record the peak situation on a single day. For States like Odisha where the topography is quite gentle, the flood inundation remains same for few days, even after the peak has passed. Hence, in most of the cases, satellite data acquired even after the flood peak represents the peak situation. Observed flood inundation includes flooding due to embankment breaches and also due to rainwater accumulation in low lying areas.

4.0 OBSERVATIONS

4.1. FLOOD HAZARD ZONES

Based on the analysis of about 100 satellite datasets, acquired during floods of 2001-18, the flood hazard layer was derived. Fig- 11 shows the flood hazard map prepared for Odisha. Table- 28 shows the flood hazard area computed under various categories. Following are the observations:

Fig 11: Flood Hazard Map of Odisha State

- About 8.96% (13.96 lakh hectares) of land in Odisha state is affected by flood during 2001-2018 (Table-27).
- Out of total flood affected area (13.96 lakh hectares), about 2.81 lakh hectares of land falls under high (inundated 7-9 times) to very high (inundated 10-14 times) flood hazard categories.
- Within flood hazard zones, the percentage area of each flood hazard category varies from 7.26 to 37.36.

Table-27 Flood Hazard Area under Various Categories

Sl no	Hazard Severity	Flood Hazard Area (ha)	% Flood Hazard (wrt State Geographic Area)	% Flood Hazard (wrt Total Flood Hazard Area)
1	Very High	1,01,339	0.65	7.26
2	High	1,80,599	1.16	12.94
3	Moderate	1,98,079	1.27	14.19
4	Low	5,21,762	3.35	37.36
5	Very Low	3,94,341	2.53	28.25
	TOTAL	13,96,640	8.96	100.00

Fig- 12 Percentage of various hazard categories wrt total hazard in the state

4.2 FLOOD HAZARD RANKING INDEX

- Table 28 provides district-wise details of the flood hazard ranking index.
- Based on the flood hazard index derived it can be said that out of 30 districts, about 08 districts namely Bhadrak, Kendrapara, Jagatsinghpur, Balasore, Puri, Jajpur, Khordha and Cuttack districts are worst affected districts. These are coastal districts and are termed worst affected based on the district flood hazard area. (Refer table 28)
- Figure 13 (a-i) shows the flood hazard map for the 08 worst flood affected districts.
- It can be observed that about a maximum of 8.43 lakh hectares of cropped area is under various categories of flood hazard. Out of which about 1.36 lakh hectares of cropland falls under very high to high flood hazard zones. District-wise details of cropped area in different flood hazard zones is given in Table-29.

Figure 13 (b-i) shows the flood hazard map for the 8 worst flood affected districts.

Table-28: District-wise Flood Hazard Area

Sl. No	District	Geographical Area(ha)	Total Flood Hazard Area (Hectares)	% Flood Hazard	Flood Hazard Index	Rank

4.3. GROUND VALIDATION

The flood hazard maps were provided to Odisha State Disaster Management Authority (OSDMA). Subsequently these maps were distributed further to each district administration and feedback was obtained. Almost all districts have provided positive feedback.
